

Veritytype

A Slack-native fact-checker that renders chart-rich verdict cards.

Track 1 : New Slack Agent · TypeScript Coded Agent · MCP + Real-Time Search

Misinformation moves faster than the team can Google.

Stats and half-truths land in channel, get three emoji reacts, and become 'fact' by lunch. The person who pushes back has to do their homework alone, in a side tab, and disrupt the thread.

How it goes today

- Claim drops in #general at 09:47.
- Three reactions, no challenge.
- Someone tries to push back at 10:30, has to Google for ten minutes.
- Source debate derails the channel for the rest of the morning.

Veritype offers a one-tap verification, in thread, in seconds.

Listen

A Haiku 4.5 classifier reads every channel message and decides what is a verifiable, public-interest claim.

step 1

Verify

Opus 4.7 with web_search fans out, reads primary sources, and produces a JSON verdict with confidence and citations.

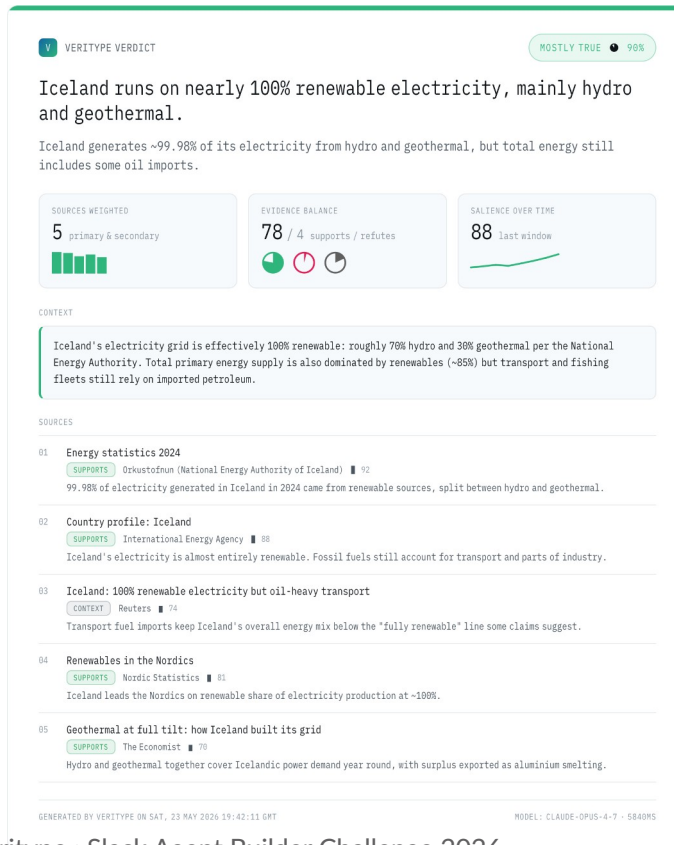

step 2

Render

We paint the verdict as a Datatype-font card. Plain text like {b:20,45,70} renders as a real bar chart.

step 3

Datatype turns plain text into inline charts.

Reading the card

MOSTLY TRUE pill

verdict + confidence as {p:98} pie + percentage

Source weights

{b:92,88,74,81,70}: primary docs sit taller than blogs

Evidence balance

three pies for supports / refutes / context

Salience sparkline

{l:22,28,35,30,42,55,70,88}: how often the claim is showing up

Citations

every source has stance, weight, publisher, excerpt

One brain, three surfaces.

The Slack bot, the MCP server, and the CLI/dashboard all call the same core module.

Slack Bolt app

Socket Mode, /verify, message events, button handlers

MCP server

stdio transport, 3 tools, plug into any MCP client

CLI / Dashboard

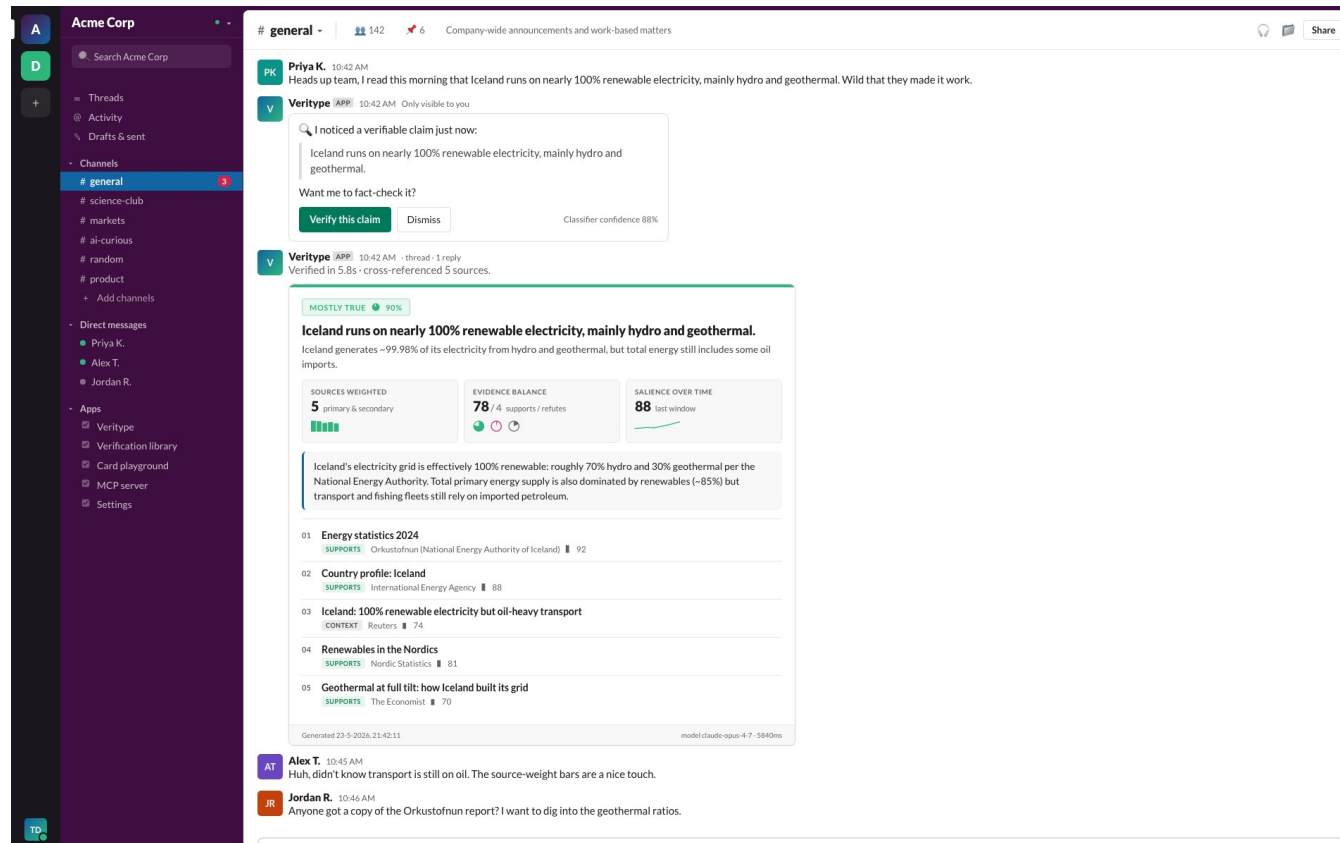

render cards offline, demo + admin UI

src/core : screen → research → render

Haiku 4.5 (screener) · Opus 4.7 + web_search (research) · Puppeteer + Datatype font (PNG card)

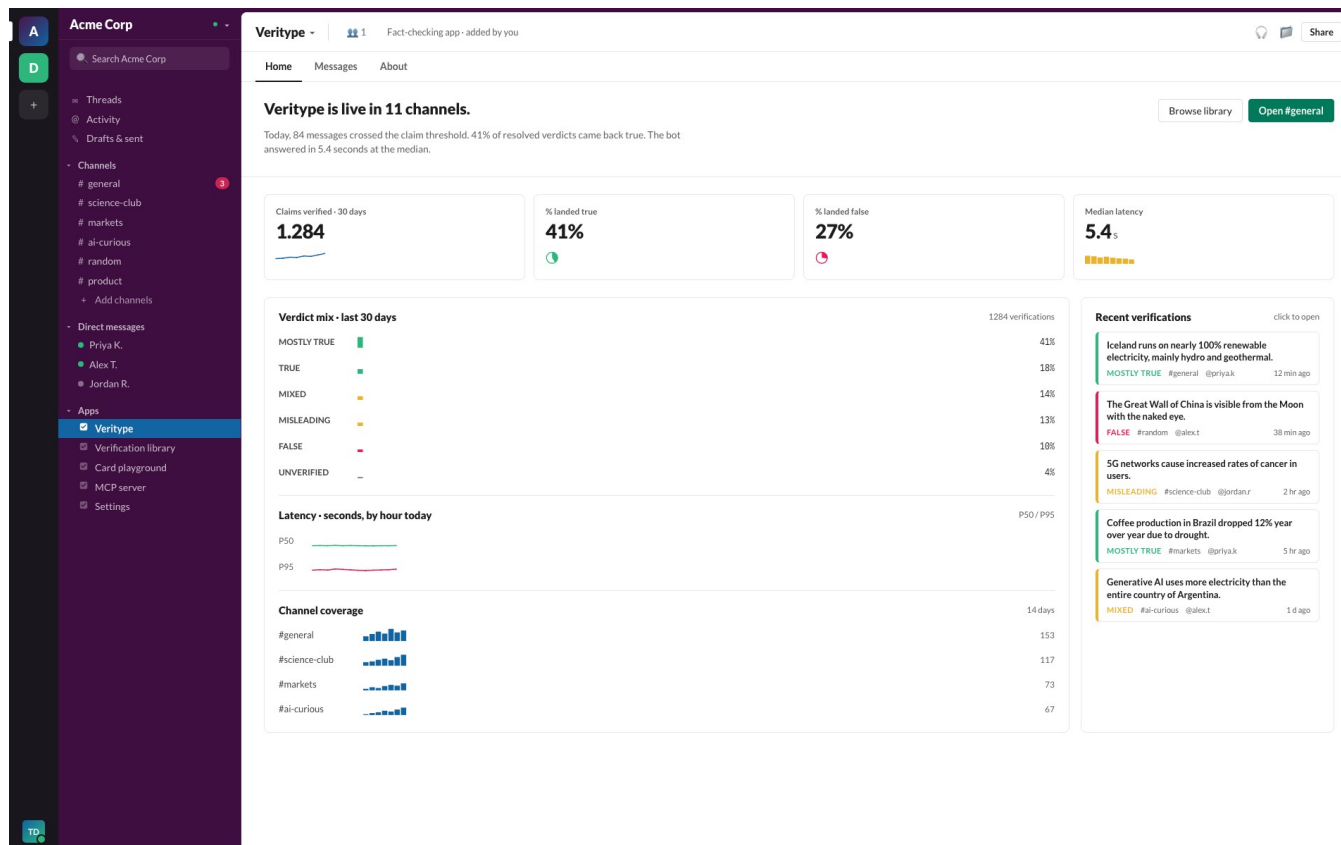

It feels native because it is native.

Ephemeral offer, threaded verdict, Block Kit mrkdwn fallback for accessibility.

Admins get a Slack-style dashboard.

Live KPIs in Datatype charts. Verdict distribution, latency, channel coverage, library.

We score on every judging axis.

Tech implementation

Coded Agent in TypeScript. Haiku 4.5 + Opus 4.7 + web_search. MCP server reuse. Puppeteer pipeline.

Design

Fully Slack-skinned. Aubergine sidebar, workspace rail, Block Kit verdict, Datatype charts.

Idea quality

Nobody else is rendering charts via a font in Slack. The proactive ephemeral offer is novel UX.

Impact

Misinformation friction inside Slack maps directly to trust at every team using it.

Required pillars

Hits MCP + Real-Time Search. Two of three checked off, not just one.

THANK YOU.

Try Veritytype yourself.

Live workspace : acme-corp.slack.com · Repo : github.com/timdries/veritytype

MCP config : drop into Claude Desktop and the same brain is yours.

Slack-native fact-checking, with charts that ride inside type.
